ASIA Conceptual Quality Audit

Objective: To ensure that the methodology and objectives you wrote in Chapters 1-3 are actually "Enterprise-Ready" before you start coding.

1. ISO 25010: The Quality Radar (Research & Visualization)

- **The Concept:** Software isn't just "good" or "bad." Its quality is measured by 8 specific characteristics defined by the **ISO 25010** standard.
- **Task:** Research the 8 pillars of ISO 25010. Create a **Radar Chart** (Spider Chart) showing which pillars are the most important for *your* specific project.
- **What to Input:**
 - **The Graph:** 8 axes representing the ISO pillars.
 - **The Spikes:** If your project is a **Medical System**, your "Security" and "Reliability" axes should be at 100%. If it's a **Game**, "Usability" and "Performance" might be higher.
- **The Narrative:** Write 2-3 sentences justifying why you prioritized those specific pillars based on your **Chapter 1 Project Context**.

2. Conceptual Data Path: The "Integrity" Map (Diagram & Logic)

- **The Concept:** In **Chapter 3 (Methodology)**, you defined how your system works. Now, visualize how a single piece of information travels through your 3-Tier Architecture (Presentation, Business, and Data).
- **Task:** Create a diagram showing the path of data from the User's screen to the Database.
- **The "Audit" Point:** Identify one "Check-Point" in your diagram.
- **What to Input:**
 - **The Diagram:** A 3-Tier flow showing the UI, the API/Logic, and the Database.
 - **The Narrative:** Describe what happens if the data is wrong. *Example: "At the Business Tier, our system will conceptually check if the User Input is empty before sending it to the Database to prevent errors."*

3. The Performance Scaling Curve (Graph & Prediction)

- **The Concept:** Performance Tuning isn't just about speed; it's about **Scalability**. How many users can your proposed Chapter 3 design handle before it crashes?
 - **Task:** Based on the **Target Users** you identified in **Chapter 1**, create a line graph predicting system behavior.
 - **What to Input:**
 - **The Graph:** X-axis = Number of Users; Y-axis = Response Time (Seconds).
 - **The "Break Point":** Mark the spot where you think your single-server setup will slow down.
 - **The Narrative:** Explain how this justifies the **Load Balancer** or **High Availability** strategy you planned in your Material 1.
-

Student Instructions for the 3-Minute Presentation

"Class, look at your Chapters 1-3. Today, you are defending the 'Logic' of your design."

1. **Present the Radar:** Show us your ISO priorities. Why is your project's 'Security' more important than its 'Portability'?
2. **Trace the Path:** Show your 3-Tier diagram. Point to where you will conceptually 'Validate' data to ensure it stays accurate (Data Integrity).
3. **Show the Curve:** Present your Performance Graph. Based on your research of your target clients, at what point does your system need to scale up?
